Leptospirosis

Leptospirosis is an infectious zoonotic bacterial disease with variable manifestations. Disease transmission may be through: contact of skin, especially if abraded, or of mucous membranes with moist soil, vegetation contaminated with urine with infected animals or contaminated water as swimming, wading in flood waters, accidental immersion or occupational abrasion; direct contact with urine or tissues of infected animals.

PIDSR Case Definition for Leptospirosis

**Suspected Case**
A person who developed acute febrile illness with headache, myalgia and prostration associated with any of the following possibly after exposure to infected animals or an environment contaminated with animal urine
- Conjunctival suffocation
- Meningeal irritation
- Anuria or Oliguria and/or proteinuria
- Jaundice
- Hemorrhages (from intestines or lungs)
- Cardiac arrhythmia or failure
- Skin rash

**Probable Case**
A suspected case in an ongoing epidemic or an environment contaminated with animal urine (e.g. wading in water floods, rice fields, drainage)

**Confirmed Case**
A suspected case that is laboratory confirmed.
I. Trend in the Philippines
A total of 3,011 leptospirosis cases were reported nationwide from January 1 to November 30, 2019 [Figure 1]. This is 41% lower compared to the same time period last year (5,116) [Table 2].

Figure 1. Reported Leptospirosis Cases by Morbidity Week (N=3,011)
Philippines, January 1 to November 30, 2019 Alert and Epidemic Threshold

II. Geographic Distribution of Cases
Most of the cases were from the following regions: NCR (1,125 or 37%), REGION III (333 or 11%), REGION I (297 or 10%), REGION IV-A (294 or 10%), and REGION VI (281 or 9%). All regions showed a decrease in the number of reported cases this year except for Region II (68% increase), Region V (24% increase) and CAR (12% increase) (Table 2).

*From period of January 1 to November 30, 2019
**From period of January 1 to November 30, 2018
III. Profile of Cases
Age of cases ranged from less than 1 year to 88 years (median = 31 years) [Figure 2]. Majority (2,580 or 86%) of cases were male. Most (443 or 15%) of the cases belonged to the age group of 20-24 years old. There were 314 deaths (CFR = 10%).

Figure 2. Reported Leptospirosis Cases by Age Group and Sex (N=3,011)
Philippines, November 2019

IV. Laboratory Status of Leptospirosis Cases
Out of the 3,011 reported leptospirosis cases, 1,151 cases (38%) were tested for laboratory confirmation. Of these, 285 cases (25%) yielded positive results [Figure 3].

Figure 3. Laboratory Status of Reported Leptospirosis Cases
Philippines, November 2019

3,011 reported leptospirosis cases

1,151 (38%) cases tested for laboratory confirmation

381 (33%) negative leptospirosis cases

285 (25%) positive leptospirosis cases

3 (0.2%) probable leptospirosis cases

482 (42%) pending laboratory status

96 (34%) positive via culture

177 (42%) positive for MAT Microscopic Agglutination Test

12 (4%) positive for pathogenic Leptospira DNA

*From period of January 1 to November 30, 2019
V. Profile of Confirmed Leptospirosis Cases
A total of **285** confirmed leptospirosis cases were reported nationwide from January 1 to November 30, 2019. Most of the cases (38 or 13%) were reported on Morbidity 34 [Figure 4].

**Figure 4. Confirmed Leptospirosis by Morbidity Week (n=285)**
Philippines, November 2019

VI. Geographic Distribution of Confirmed Leptospirosis Cases
Most of the confirmed leptospirosis cases were from **NCR** (172 or 60%) followed by **REGION IV-A** (39 or 14%). A total of sixteen (16) deaths were noted: seven were from NCR (CFR 4%), one from Region II (CFR 7%), one from Region III (CFR 14%), three from Region IV-A (CFR 8%), three from Region VI (CFR 17%) and one from ARMM (CFR 100%).
