

Newly Diagnosed HIV Cases in the Philippines

In February 2010, there were 130 new HIV Ab seropositive individuals confirmed by the STD/AIDS Cooperative Central Laboratory (SACCL) and reported to the HIV and AIDS Registry (Table 1). This was a 177% increase compared to the same period last year (n=47 in 2009) [Figure 1].

Most of the cases (92%) were males. The median age was 26 years (age range: 2-71 years). The 20-24 year (30%) and 25-29 year (34%) age-groups had the most cases. Sixty-two percent (80) of reported cases were from the National Capital Region (NCR).

Reported mode of transmission was sexual contact (120), sharing of infected needles among injecting drug users (5) and mother-to-child transmission (1). (Table 2, page 2). Four did not mention mode of transmission. Homosexual contact was the predominant type of sexual transmission [Figure 2]. Most (99%) of the cases were still asymptomatic at the time of reporting [Figure 3]. There were no reported deaths for this month.

AIDS CASES

Of the 130 HIV positive cases, one was reported as AIDS. A single male who acquired the infection through homosexual contact.

Overseas Filipino Workers (OFW)

Nine of the 130 (7%) reported cases were OFWs [Figure 9, page 3]. Seven (78%) were males. The median age was 32 years (age range: 26-53 years). All cases acquired the HIV infection through sexual contact (5 heterosexual, 3 homosexual, and 1 bisexual).

Table 1. Quick Facts

Demographic Data	Feb 2010	Jan-Feb 2010	Cumulative Data: 1984-2010
Total Reported Cases	130	273	4,697
Asymptomatic Cases	129	270	3,862
AIDS Cases	1	3	835
Males	120	245	3,477*
Females	10	28	1,209*
Youth 15-24yo	44	91	815
Children <15yo	1	1	53
Reported Deaths due to AIDS	0	0	318

*Note: No data available on sex for eleven (11) cases.

*Five initially asymptomatic cases reported in 2008 died due to AIDS in same year.

AIDS Cases (1984-2010)

Of the 273 HIV positive cases in 2010, three were reported as AIDS. These positive cases were three males who acquired the infection through homosexual contact. Ages ranged from 23-38 years. There were no reported deaths for February.

For 1984 to 2010, there were 835 AIDS cases reported, 71% (591) were males. Median age was 36 years (range 1-72 years). Thirty-eight percent (314) had already died. Sexual contact was the most common mode of HIV transmission, accounting for 93% (775) of all AIDS cases. More than half (443) of sexual transmissions was through heterosexual contact, followed by homosexual contact (260) then bisexual contact (72). Other modes of transmission include: mother-to-child transmission (17), blood transfusion (10), injecting drug use (4), and needle prick injuries (2) [Figure 4]. Three percent (27) of the AIDS cases did not report mode of HIV transmission.

Fig 4. Proportion of Types of Sexual Transmission, Jan 1984–Feb 2010

Demographic Characteristics (1984-2010)

In 2010, there were a total of 273 cases reported. 90% of the cases reported were males (245). The 25-34 years old age group (49%) had the most number of cases for 2010. For the male age group, the most number of cases were found among the 25-34 years old (51%) and 15-24 years old (32%) age group [Figure 5].

From 1984 to 2010, there were 4,697 HIV Ab seropositive cases reported (Table 1), of which 3,862 (82%) were asymptomatic and 835 (18%) were AIDS cases. As evident in Figure 6, there is a significant difference in the number of male and female cases reported. Seventy-four percent (3,477) were males. The age groups with the most number of cases were: 25-29 years (23%), 30-34 years (20%) and 35-39 years (16%) [Figure 6].

Figure 6. Comparison of the Distribution of Male and Female HIV Cases by Age-Group and Certain Highlighted Years

Modes of Transmission (1984-2010)

In 2010, 77% (209) were infected through sexual contact, 20% (55) through needle sharing among injecting drug users and 0.4% (1) through mother-to-child transmission (Table 2). There were 189 males and 20 females infected through sexual transmission. Their ages ranged from 18-71 years old. There were 48 males and 7 females who were infected through sharing of needles. Their ages ranged from 16-49 years old. [Figure 7].

Of the 4,697 with HIV, 90% (4,203) were infected through sexual contact, 1% (50) through mother-to-child transmission and 1% (63) through needle sharing among injecting drug users. Other modes of transmission are listed in Table 2. No data is available for 8% (359) of the cases. Cumulative data shows 54% (2,258) were infected through heterosexual contact, 30% (1,281) through homosexual contact, and 16% (664) through bisexual contact. From 2007 there has been a shift in the predominant trend of sexual transmission from heterosexual contact (31%) to males having sex with males (69%) [Figure 8].

Table 2. Mode of HIV Transmission

Mode of Transmission	Feb 2010 n=130	Jan-Feb 2010 n=273	Cumulative N=4,697
Sexual Contact	120	209	4,203
<i>Heterosexual contact</i>	21 (18%)	44 (21%)	2,258 (54%)

Overseas Filipino Workers (OFW)

In 2010, there were 16 HIV positive OFWs, comprising 6% of cases reported for the year [Figure 9]. Of these, 12 (75%) were males and 4 (25%) females; all infected through sexual contact.

There were 1,364 HIV positive OFWs since 1984, comprising 28% of all reported cases [Figure 9]. Seventy-four percent (1012) were males. Ages ranged from 18 to 69 years (median 36 years). Sexual contact (96%) was the predominant mode of transmission (Table 3). Eighty-one percent (1099) were asymptomatic while 19% (265) were AIDS cases.

Table 3. Reported Mode of HIV Transmission Among OFWs

Mode of Transmission	Feb 2010 n=9	Jan-Feb 2010 n=16	Cumulative N=1,364
Sexual Transmission	9	16	1,302

Program Related Information

Of the 130 HIV cases reported in February 2010, one was classified as AIDS.

Fifty-two percent of the cases received information on HIV prevention, services available for HIV cases, implications of an HIV positive result from screening and confirmation. Their sources of information were one-on-one counseling, group counseling, pre-departure orientation seminar (PDOS), pamphlets, videos, internet and seminars.

Blood Units Screened for HIV

Note: The following information is from the National Voluntary Blood Safety Program (NVBSP) which monitors blood safety of donated blood. HIV reactive blood units are referred to the Research Institute for Tropical Medicine (RITM) for confirmation. RITM is the National Reference Laboratory for the NVBSP.

From January to February 2010, 21 blood units were confirmed to be positive by the RITM.

For February 2010, out of the 89 blood units referred for HIV confirmation, 12 units were positive for HIV, 3 units had indeterminate results, and 74 units were negative for HIV [Table 4].

Philippine HIV & AIDS Registry

The Philippine HIV & AIDS Registry is the official record of the total number of laboratory-confirmed HIV positive individuals, AIDS cases and deaths, and HIV positive blood units in the Philippines. All individuals in the registry are confirmed by the STD/AIDS Cooperative Central Laboratory (SACCL) at San Lazaro Hospital. While all blood units are confirmed by the Research Institute for Tropical Medicine (RITM). Both are National Reference Laboratories (NRL) of the Department of Health (DOH).

Mandatory HIV testing is unlawful in the Philippines (RA 8504). The process of reporting to the Registry is as follows: All blood samples from accredited HIV testing facilities that are screened HIV reactive are sent to SACCL (individuals) or RITM (blood units) for confirmation. Confirmed HIV positive individuals and blood units are reported to the DOH-National Epidemiology Center (NEC), and are recorded in the Registry.

The Registry is a passive surveillance system. Except for HIV confirmation by the NRL, all other data submitted to the Registry are secondary and cannot be verified. An example would be an individual's reported place of residence. The Registry is unable to determine if this reported address is where the person got infected, or where the person lived after being infected, or where the person is presently living, or whether the address is valid. This limitation has major implications to data interpretation. Thus, readers are cautioned to carefully weigh the data and consider other sources of information prior to arriving at conclusions.
