ACUTE MENINGITIS-ENCEPHALITIS SYNDROME SURVEILLANCE
CASES IN THE PHILIPPINES

Introduction

The Epidemiology Bureau (EB) mandated to oversee disease surveillance functions. It established the Philippine Integrated Disease Surveillance and Response (PIDSR) system in 2007 under which the Bacterial Meningitis and Acute Encephalitis Syndrome (AES) surveillance falls. An integrated surveillance for Acute Meningitis-Encephalitis Syndrome (AMES) Surveillance was initiated because both AES and bacterial meningitis present as acute Central Nervous System (CNS) infections. With such overlap in the case presentations, this may result in difficulties in distinguishing the two syndromes. Moreover, cerebrospinal fluid (CSF) is important in the diagnosis and laboratory confirmation of both disorders.

Acute Encephalitis Syndrome (AES) is an illness clinically characterized by fever, change in mental status and/or new onset of seizures (excluding simple febrile seizures in children). AES is used as a surrogate syndrome for Japanese Encephalitis (JE) cases in surveillance. In the Philippines, JE has been detected in swine and mosquitoes, respectively. JE is believed to be endemic in the whole country with laboratory confirmed infections from various parts of the country.

Majority of the bacterial meningitis affecting young children are caused by three vaccine-preventable organisms: Haemophilus influenza type b (Hib), Streptococcus pneumoniae and Neisseria meningitidis. In the Philippines, the surveillance system targets bacterial meningitis of all age groups. These organisms cause severe invasive disease affecting the central nervous system (CNS) (meningitis), lungs (pneumonia) and blood (sepsis).

Trend

A total of 9 AMES suspected cases were reported from selected sentinel sites from January 1 to 31, 2015 (Figure 1). All laboratory results from 2 sentinel sites are still pending (Table 1).

Geographic distribution

The distribution of suspected AMES cases varied considerably among the sentinel sites (Figure 2). The majority of the reported cases were from Baguio General Hospital and Medical Center (56%) (Figure 2).

Profile of cases

Seventy-eight percent of suspected AMES cases are less than 1 year old (Figure 3). Sixty-seven of the suspected AMES cases were male (Figure 3). Among the suspected AMES cases, only 11% received measles vaccination measles vaccine (Figure 4). None died (CFR=0.0%).

CASE DEFINITION of Acute Meningitis-Encephalitis Surveillance

A combined case definition for AES and BM surveillance shall be used. Suspected cases will be captured through the standard case definition of **Acute Meningitis-Encephalitis Surveillance** System (includes meningitis, encephalitis, and overlapping cases)

A case of suspected Acute Meningitis-Encephalitis is a person of any age, WITH a sudden onset of fever, plus one of:
- change in mental status (including altered consciousness, confusion, or inability to talk)
- new onset of seizures
- neck stiffness
- other meningeal sign

**Selected Sentinel Sites of Acute Meningitis-Encephalitis Surveillance**
- **Region 1**: Ilocos Training Regional Medical Center
- **Region 2**: Cagayan Valley Medical Center
- **Region 3**: Jose B. Lingad Memorial Regional Hospital
- **Region 5**: Bicol Medical Center
- **Region 6**: Western Visayas Medical Center
- **Region 7**: Vicente Sotto Memorial Medical Center
- **Region 11**: Southern Philippines Medical Center
- **Region NCR**: Philippine Children's Medical Center
- **Region CAR**: Baguio General Hospital and Medical Center

NOTE: Disease counts reported here do NOT represent the final number and are subject to change after inclusion of delayed reports and review of cases.
